## Simplify PCI and Sarbanes Oxley Compliance

The powerful functionality and continued development of the QSystems Management Suite is driven by our commitment to meet the ever-changing, real-world needs of our customers. That's why QMessage Monitor and QSystem Monitor have become the products of choice for leading organizations around the world. Learn more about simplifying PCI and Sarbanes Oxley Compliance for your business with these examples.

*“The nature of our business means we process hundreds of thousands of payment card transactions each year and are required to have an effective way to monitor for PCI DSS (Payment Card Industry Data Security Standard) compliance auditors.”*

MESSAGE  
monitor

QMessage Monitor (QMM) can help businesses set up, maintain and monitor their important audit journals on a 24/7 basis. To meet compliance regulations, companies must prove to auditors that the systems running the credit card applications are adequately monitored. QMM produces a report that goes into a spool file which can be saved and reviewed each day. Users can also monitor these important journals from their desktop in real-time and receive QMM alerts should any out of the ordinary situations occur.

*“We want to free up resource on our system but can't delete audit journal messages because Sarbanes Oxley guidelines require them to be available at all times.”*

MESSAGE  
monitor

Using QMessage Monitor's command, MMARCLOG, audit journal messages can be identified as a separate member, saved to tape and deleted from the system, freeing valuable resource. The result is an 'on-demand' data environment that is incredibly easy to manage without the substantial storage expense of purchasing additional disk.

*“We have a manual operational checklist that should be completed each day. When we are really busy, the tasks on the checklist are sidelined. Ultimately, this results in more time-consuming problems. Incomplete checklists are virtually useless as an analysis tool. Is there a better solution?”*

MESSAGE  
monitor

Automating routine checklists (by creating a system message for each task) with QMessage Monitor (QMM) is a fast way to ensure team members respond and are accountable in the same way they are accountable for urgent system messages. QMM sends real-time prompts to individuals or groups which can be escalated to a number of communication devices. This not only creates better operational efficiency but ensures that compliance to industry standards such as SOX, HIPPA or PCI is maintained on a daily basis.
